(54) INFORMATION DISPLAY DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To obtain a rich expression by sending prescribed message data consisting of a prescribed numeral string through a public line in a form of DTMF signals and giving a message decoded at a receiver side to a television receiver so as to effectively utilize existing media.

SOLUTION: A ten-key or the like of a pushphone at a transmitter side uses to enter a desired message to a telephone set 3 as a DTMF tone and it is sent via a public line 12. An NCU 50 of a receiver side information display device 11a identifies the signal not to be a usual voice signal and gives it to a CPU 54 via a modem 51. The CPU 54 references a decoding code table in a ROM 53 to convert the signal into a message, which is stored in a RAM 52. Based on a user command from an operation entry section 57a, the message read from the RAM 52 is sent to a television receiver as an RF signal 100 from an antenna 59 via an NTSC encoder 55 and an RF modulator 56, in which the signal is outputted as an image and an audio signal.

LEGAL STATUS

[Date of request for examination] 22.06.2000

[Date of sending the examiner's decision of rejection] 02.12.2003

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
